Thanks to the mentoring I had with Lizeth, I received very good feedback on possible improvements in my challenge.

Since I created custom objects to carry out the project, I ended up doing all the formulation from scratch and did not 100% use what Salesforce offers its developers with its standard objects.

This turned out to be the "quickest and easiest" option if we look at it in some way, however, the fact is that having created a project in this way makes it not as scalable, and the consequences may not show at first, but later on, it affects the governor limits and limits future changes.

Additionally, when considering future projects, if I were to share something like this Org with a Salesforce Architect, he would most likely point out that some customizations were unnecessary.

This experience has taught me the importance of making the most of native Salesforce resources. Therefore, I would like to undertake a new similar project on my own, with the intent of minimizing the number of custom objects, to achieve a more efficient solution aligned with best practices.

I deeply appreciate the experience and time that the Liderly team has given us, as well as the opportunity to take this important step in our professional development.
